

Use Case 2: Retail (E-commerce)

Project Title: The Contextual Image Agent

An advanced AI agent system that revolutionizes the online shopping experience by dynamically generating product images that match the unique personal style of every customer, in real-time.

The Business Problem

- **The Pain Point:** Our static, one-size-fits-all product photography is failing to connect with our diverse customer base. Shoppers see a generic product in a generic setting, leading to a "visualization gap." They can't envision the product in *their* home or as part of *their* life, resulting in high bounce rates, low engagement, and lost revenue.
- **The C-Suite Objective:** We must increase our e-commerce conversion rate by 10% and significantly boost customer engagement by creating a deeply personal, visually compelling shopping journey that turns browsers into buyers.

The AI Agent Solution

- **High-Level Agent Architecture:** The Contextual Image Agent is a multi-agent system that is used to build out customer specific images for when the customer views a product. It analyzes the customer's taste and the product's details to generate a unique lifestyle image tailored to them.
- **Data Sources** (find or generate):
 - Customer profile and shopping history (CRM). Hint: Contains browsing history, past purchases, and inferred style preferences (e.g., "modern," "bohemian," "likes warm colors").
 - Product catalog: Contains product details, including a link to existing product images
 - Brand asset library: A collection of approved background scenes, textures, and logos.
- **Considerations:**
 - **Experience Orchestrator:** When a customer lands on a product page, the main agent initiates the personalization process.
 - **Customer Analyst:** This agent concurrently accesses the **customer profile & history** (CRM data). It analyzes browsing patterns, past purchases, and wish lists to infer the customer's dominant style affinity (e.g., "prefers 'modern farmhouse' aesthetic with 'cool, muted colors'").
 - **Product Analyst:** This agent reads the **product catalog** to fetch the details of the item being viewed, including its name, color, and a link to its high-quality,

transparent-background image (e.g., Product: "'Portside' Dining Chair, Color: 'Natural Oak'").

- **Decision & Synthesis:** Craft a highly specific, on-brand prompt for the image generator, pulling from an approved **brand asset library** for background scenes and textures.
- **Image Generator:** This creative agent takes the prompt and the transparent product image. It composites them into a brand-new, photorealistic lifestyle image that perfectly places the product within the customer's preferred visual context. The Experience Orchestrator then displays this image as the hero shot on the product page.
